

# 1. Overview of Aurora Library

Aurora Library is a fictional digital library system designed to help students discover, borrow, and manage educational resources. The system provides books, research reports, tutorials, and multimedia learning materials. Its main goal is to make reliable learning content easy to find while keeping borrowing records simple to manage.

## Key facts

- The library serves students, teachers, and independent learners.
- Users can search resources by title, author, subject, or keyword.
- Each resource has a unique identifier and a current availability status.
- The system records borrowing and return activity.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 2. User Accounts

Aurora Library supports three main account types: Student, Teacher, and Librarian. Students can search and borrow resources. Teachers can recommend resources and create reading lists. Librarians manage the catalogue, user accounts, and borrowing policies.

### Key facts

- A student may borrow up to five resources at one time.
- A teacher may create shared reading lists for a class.
- Librarians can add, edit, archive, and restore catalogue records.
- Every account has a unique user ID.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 3. Search and Discovery

The search service helps users locate relevant resources. A search can use a complete title, part of a title, an author's name, or a subject keyword. Results are ranked using relevance, availability, and recent usage. Filters allow users to narrow results by subject, resource type, and publication year.

### Key facts

- Search results display the title, author, subject, and availability.
- Available resources appear before unavailable resources when relevance is equal.
- Users can combine multiple filters.
- The search system does not change catalogue records.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 4. Borrowing Process

When a user selects an available resource, the borrowing service creates a borrowing record. The record contains the user ID, resource ID, checkout date, and due date. The resource status changes from Available to Borrowed. A user cannot borrow the same physical copy twice at the same time.

### Key facts

- The standard borrowing period is fourteen days.
- The system checks the user's borrowing limit before checkout.
- A successful checkout produces a confirmation message.
- The due date is calculated from the checkout date.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 5. Returns and Renewals

A resource can be returned through the library interface or by a librarian. When a return is recorded, the borrowing record is closed and the resource becomes Available. Users may request one renewal when no other user has reserved the resource.

### Key facts

- A renewal adds seven days to the original due date.
- Renewal is unavailable when another user has placed a reservation.
- The return process records the actual return date.
- The system updates availability immediately after a successful return.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 6. Reservations

If a resource is currently borrowed, a user can place a reservation. Reservations are processed in the order they were created. When the resource becomes available, the first eligible user receives a notification. A reservation remains active for forty-eight hours after notification.

### Key facts

- A user may have up to three active reservations.
- Reservations are linked to a specific resource.
- Cancelled reservations are removed from the active queue.
- Expired reservations allow the next user in the queue to be considered.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 7. Recommendations

Aurora Library includes a recommendation feature intended to help users discover related learning materials. Recommendations can be based on subjects in a user's reading history, resources saved to a reading list, and frequently borrowed materials.

### Key facts

- Recommendations are suggestions rather than required reading.
- The system can recommend resources from related subjects.
- Users can hide an unwanted recommendation.
- Librarians can promote selected resources to a featured list.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 8. Notifications

The notification service sends messages about borrowing activity, reservations, and account events. A user may receive a reminder three days before a resource is due. Reservation notifications are sent when a requested resource becomes available.

### Key facts

- Users can choose email or in-app notifications.
- Due-date reminders are informational.
- A notification includes the relevant resource title.
- The system records whether an in-app notification has been viewed.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 9. Security and Data Management

Aurora Library protects account information by requiring authenticated access to personal borrowing records. Librarians have additional permissions for catalogue and account management. The system keeps an audit record of important administrative changes.

### Key facts

- Users can view their own borrowing history.
- Students cannot edit catalogue records.
- Librarians can review administrative audit records.
- Passwords are not stored as plain text.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.

## 10. Future Improvements

Future versions of Aurora Library may introduce improved search ranking, mobile notifications, accessibility enhancements, and analytics for librarians. Another planned feature is a reading-progress dashboard that would allow users to organize learning goals and track completed resources.

### Key facts

- The planned reading-progress dashboard is not part of the current system.
- Accessibility improvements may include better keyboard navigation.
- Analytics could help librarians identify popular subjects.
- Future features will be evaluated before implementation.

Testing note: This section contains deliberately distinct facts so that a RAG application can be tested with questions about different pages, exact values, limits, dates, and rules.
